Before You Begin

There is a moment, somewhere past the halfway mark of a long manuscript, when the book grows larger than the head holding it. You can no longer remember whether the war ended in the spring or the autumn, whether your detective has met the widow yet, whether chapter nine still drags the way it did three revisions ago. The book knows these things. You wrote them. But knowing and **holding** are different, and no writer holds a whole book at once.

This is a book about the second kind of knowing. Inkhaven cannot write your novel — and would not try — but it can **hold your book for you**: remember its facts, watch its continuity, track who knows what, read it the way a stranger would, listen to its voices, and tell you, draft to draft, whether it is getting better. Every one of these is a way of **knowing your book**, and this guide is a tour of all of them.

What this book covers

Inkhaven's knowledge features are not one tool but a family, each answering a different question you would otherwise have to answer from memory:

● ● ● *The questions — and who answers them*

the Facts bible	Is this fact right, sourced?
the graph	How does it all connect?
SENTINEL	Does the continuity hold?
KEN	Could they know this yet?
LECTOR	How does the whole thing read?
CHORUS	Do the voices differ?
CHRONICLE	Did the revision help?
CANON	What breaks if I cut this?
	— these ask, they don't answer
Inner Socrates	Have I earned this claim?
Inner Editor	Is the prose doing its job?
Inner Theologian	Is the moral weight honest?
Inner Poet	Does the verse keep its form?

The first group **tells you what is true** — the state of your book. The last group — the **inner readers** — does something quieter and stranger: it **asks whether you have earned it**. A Socratic questioner will not fix your argument; it will name the premise you never said aloud. Both are ways of knowing your book, and Part VI is given to the readers who question.

You do not have to use all of them, and few books need every one. Read the chapter for the question that is nagging you today; the book is arranged so each stands on its own.

Who this book is for

This guide assumes **no prior knowledge** — of Inkhaven, or of the craft-analysis ideas behind these features. Every term is introduced the first time it is needed, in a marked box:

TERM **Advisory**

Every feature in this book is **advisory**. It observes, measures, and reports; it never edits your prose on its own. The reader points; the author decides. When a change is made, you see it as a diff and confirm it, and your old words are always one keystroke back.

It also keeps two kinds of author in view — the novelist and the non-fiction writer — because the intelligence serves both, though it serves them differently:

FICTION

The novelist leans hardest on **continuity**, **who-knows-what**, and **voice** — the machinery of a world with secrets and a cast who must each sound like themselves.

NON-FICTION

The non-fiction writer leans hardest on the **facts bible** and the **graph** — the machinery of claims that must be right, sourced, and coherent with each other.

One promise about cost

The word “intelligence” makes writers reach for their wallet, expecting a meter to spin every time the tool thinks. It does not. Almost everything in this book is **deterministic and free** — it reads your manuscript and its own structure, with no model involved. Where a language model genuinely helps — the subtle continuity break, a synthetic first read — it is always **explicit and cost-capped**: you ask for it, you see the estimate, and the default is off. Cost **informs**; it never surprises.

So: turn the page, and let us begin with the ground the whole book stands on — the facts it did not invent.

WHAT YOU LEARNED

- Inkhaven’s **knowledge features** are a family of tools that **hold your book for you** — its facts, continuity, who-knows-what, how it reads, how it sounds, and whether it is improving.
- Every feature is **advisory** — it observes and reports, and never edits your prose without a diff you confirm.
- The core is **deterministic and free**; any language-model help is **explicit and cost-capped**, never automatic.

KNOW YOUR BOOK

PART I

The Ground Truth

CHAPTER 1

1

The Facts Beneath

Every book rests on things that must stay true. In a novel it is the world's own law — the queen's name, the distance between two cities, the year the plague came. In non-fiction it is the borrowed fact — the population, the date, the finding a reader could look up. Get one wrong once and a reader shrugs; get it wrong **twice, differently**, and the trust is gone. Inkhaven gives these must-stay-true things a home of their own: the **Facts** book.

TERM Fact

A **fact** is a specific, checkable claim your book rests on — “the war ended in 412,” “Vienna sat on the Danube,” “she is the elder sister.” It lives in the Facts system book, apart from your prose, so the tool can hold it steady while you write around it.

The bible your book checks itself against

The Facts book is your story bible made **operational**. It is not a document you read; it is a set of claims the tool can test your manuscript against. You add to it as you go — a name here, a date there — and Inkhaven keeps them organised the way a book is, in foldable sections.

● ● ● *The Facts book — the world's must-stay-true claims*

- ▼ Facts
 - ▼ People
 - ✓ Mara is the elder of the two sisters
 - ✓ Joren served in the northern war
 - ▼ Chronology
 - ✓ The war ended in the year 412
 - ✓ The coronation follows the war by three years
 - ▼ Geography
 - ✓ Rillmark stands where the two rivers meet

The fact-check — is the page true to the bible?

Once a fact is in the book, **Ctrl+B Shift+X** checks the **open paragraph** against it — and against your compiled world. It is looking for the moment your prose and your bible disagree: a journey too fast for its distance, a season that cannot follow the last, a claim that contradicts something you already fixed as true.

● ● ● Ctrl+B Shift+X — the paragraph, against the world

Fact-check · ch. 14 ¶ the-crossing

△ "they reached Rillmark by nightfall" — the bible puts Rillmark

six days' ride away; a single day is not plausible.

- no other conflicts with the Facts book.

When the facts disagree with each other

The subtler danger is not prose-versus-bible but **bible-versus-bible**: two claims you fixed as true, months apart, that cannot both hold. `inkhaven factcheck` reads the Facts book for these internal contradictions, and the SCHOLAR tools go further — `/contradict` surfaces the source-attributed clashes, `/relate` grades a new claim against what you already believe (does it **contradict**, **qualify**, **agree**, or say nothing).

FICTION

For fiction, the Facts book is your continuity bible — the invented truths the rest of the machinery in this book checks against. It is where “who is the elder sister” stops being something you hope you remembered.

NON-FICTION

For non-fiction, every kept fact remembers **where it came from**. The Research Assistant (its own companion book) gathers and cross-checks them; here they become the ground your argument — and every other check — stands on.

The Facts book is the floor of everything that follows. The knowledge graph draws its edges over these facts; SENTINEL’s continuity watch reads them; KEN asks who **knows** them. Get this floor solid, and the rest of the house has something to stand on.

WHAT YOU LEARNED

- The **Facts book** is your story bible made operational — the must-stay-true claims your manuscript can be checked against.
- `Ctrl+B Shift+X` fact-checks the open paragraph against the bible and the world; `inkhaven factcheck` finds contradictions **within** the bible.
- SCHOLAR's `/contradict` and `/relate` grade how a new claim stands against what you already hold true.

CHAPTER 2

2

The Knowledge Graph

A book is not a list; it is a **web**. Mara is Joren's sister and the war's orphan and the coronation's reluctant guest; the war connects to the treaty connects to the famine connects back to Mara. You hold these connections loosely in your head, and they fray. Inkhaven holds them exactly, in a **graph** — a map of how everything in your book relates to everything else — and lets you ask it questions.

TERM The graph

Inkhaven's **knowledge graph** is a layer of typed connections over the things in your book — paragraphs, facts, events, characters. An edge says **how** two things relate: this cites that, this event involves her, this claim contradicts that one. You never build it by hand; the tool derives it from what you have already written.

What the edges know

The graph is not decoration — every edge is one the tool can walk. A fact **contradicts** another; a paragraph **mentions** a character; a claim is **sourced from** a passage; an event **involves** the people who were there. That last edge is the one KEN will lean on two chapters from now: the graph already knows who was present when something happened.

● ● ● *inkhaven graph stats — the web, counted*

Graph	· 1,204 nodes	· 3,881 edges	
Mentions	 2,140	(paragraph → character / place)	
EventInvolves	... 612	(event → who was there)	
Contradicts	 18	(fact ≠ fact)	
Cites	 744	(claim → source)	
Declares	 167	(world.hjson → the fact it fixes)	

Ask your book a question

The graph would be a curiosity if you could only count it. What makes it an intelligence is that you can **talk to it**. `inkhaven graph ask` takes a plain question and **walks the graph** to answer it — searching, following neighbours, chasing contradictions and paths — and it is honest about what it does not record.

● ● ● *graph ask — a question, answered by traversal*

```
> inkhaven graph ask "who has reason to want the treaty to fail?"
```

```
Walking: search 'treaty' → neighbours → contradictions ...
- Sella loses her claim if the treaty holds (ch. 6, ch. 11).
- The northern lords are bound by it against their oath (ch. 9).
- I have no recorded motive for Joren — the graph is silent there.
```

Inside the editor the same power is the **Graph** AI scope (F9) and the graph hub (Ctrl+B z): ask a question and the answer is grounded in the passages **and** the edges touching them, with the evidence one keypress away.

The graph builds itself

You do not curate this web. Deep research proposes **contradicts** edges when two findings clash; **inkhaven graph link** suggests connections from a fact to its nearest kin; and an **edge inbox** (**graph pending**, or **i** in the hub) collects these proposals for you to keep or reject. The graph grows the way your book does — a little at a time, mostly on its own.

FICTION

For fiction, the graph is where “how does everyone connect to the murder” stops being a note card wall and becomes a question you can ask out loud.

NON-FICTION

For non-fiction, the graph is the shape of your argument — which claim rests on which source, and where two of your own findings quietly disagree.

WHAT YOU LEARNED

- The **knowledge graph** is a layer of typed edges over your book — mentions, event participants, contradictions, citations — derived from what you wrote.
- **inkhaven graph ask** (and the F9 Graph scope / Ctrl+B z hub) **walks** the graph to answer a plain question, grounded and honest about gaps.
- The graph **builds itself** — contradiction and link proposals collect in an edge inbox you keep or reject.

PART II

The Book Watches Itself

CHAPTER 3

3

Continuity — Where and When

Continuity errors are the ones readers write letters about. A character in two places on the same afternoon; a wound that heals and reopens; a sum of years that does not add up; a name that changes spelling between chapters. None of them are failures of imagination — they are failures of **bookkeeping**, and bookkeeping is exactly what a tool should do so you do not have to. Inkhaven's continuity intelligence is called SENTINEL: the book watching itself.

One ledger, every detector

SENTINEL unifies the deterministic continuity checks into a single ranked ledger. It watches four kinds of slip, plus one invariant nobody usually catches:

● ● ● *inkhaven continuity check — the unified ledger*

```
Continuity ledger · 3 findings
co_location (1)
  ⊗ Mara is in the tower and the courtyard within one scene
  (ch. 3)
numeric (1)
  △ "twelve years later" contradicts the dated events (ch. 8 →
  ch. 2)
introduce (1)
  ● "Cael" is named in ch. 2 before his first scene (ch. 5)
```

- **co-location** — a character in two places at once, without the travel to connect them.
- **timeline** — events that orphan or overlap where they cannot.
- **numeric** — a span of years, a distance, a count that reverses itself.
- **character-fact drift** — a detail about someone that quietly changes.
- **referenced-before-introduced** — an entity named before its first scene (the invariant that KEN, next chapter, extends from **existence** to **knowledge**).

The dashboard, and the jump

Ctrl+B Shift+I opens the ledger in the editor. Scroll it, and press **Enter** on any finding to jump straight to the paragraph where the slip happens — the whole point is to get you to the fix in one keystroke, not to hand you a report you then have to hunt through.

TERM Ambient watch

With `continuity.ambient` on, SENTINEL re-checks **only what your edit touched** on every save — the paragraph’s entities and its chapter — and shows the delta inline. It is the difference between a checkup you schedule and a nurse who never leaves the room.

The subtle cases, on request

The patterns above are deterministic and free. For the contradictions no pattern can see — two paragraphs that disagree in meaning, not in a number — press `k` in the ledger (or `inkhaven continuity check --coherence`) to run a cost-capped language pass over the book. Explicit, budgeted, and off by default: the free checks earn their keep first.

Continuity answers **where** and **when**. It is deliberately silent about one axis it was never built to see — what a character **knows**. That axis is the next chapter, and it is the reason this book exists.

WHAT YOU LEARNED

- **SENTINEL** unifies the continuity checks — co-location, timeline, numeric, character-fact drift, and referenced-before-introduced — into one ranked ledger.
- `Ctrl+B Shift+I` opens it; **Enter** jumps to the slip. `continuity.ambient` re-checks what each save touched.
- The core is free; the LLM **coherence pass** (`k / --coherence`) is explicit and cost-capped for the contradictions patterns can’t see.

CHAPTER 4

4

Who Knows What, When

The last chapter watched **where** your characters are. This one watches something no tool watched before it: **what they know**. It is the axis a mystery lives or dies on, and the most common invisible plot-hole in the whole craft — a character acting on something they have not learned yet. Bob mentions the murder in chapter four; he is not told of it until chapter six. A reader feels the wrongness and cannot place it. You, three hundred pages deep, cannot hold every character's knowledge in your head.

KEN can. Its name is an old word for the range of what a person knows — **beyond his ken** — and that is exactly what it tracks.

TERM KEN

KEN extends SENTINEL's referenced-before-**introduced** rule to referenced-before- **known**. Where continuity flags an entity named before it exists in the story, KEN flags a character acting on a fact before they could know it. Same forward walk, a new axis: not existence, but knowledge.

The grant — when could they know it?

KEN never **guesses** what a character knows. It derives the **grant** — the earliest moment they could know something — two deterministic ways. The first is free, from the timeline you already keep: anyone present at an event knows that event from the moment it happens. The second is a tag you place, telling KEN what matters:

● ● ● The tags that declare knowledge

<code>secret:the betrayal</code>	– this topic is a secret
<code>know:the betrayal@Mara</code>	– Mara learns it here
<code>know:the betrayal</code>	– the scene's pov: character
<code>learns it</code>	
<code>reveals:the heir's true name</code>	– this event lets that fact
<code>slip</code>	

The use — and the break

With grants in hand, KEN walks the book forward. Wherever a character **references** a topic — speaks of it in attributed dialogue, or dwells on it in their own point-of-view scene — it asks the one question: **could they know this yet?** If the reference comes before the earliest grant, that is the break.

```
Knowledge check · 2 findings
  ⊗ premature_knowledge Bob speaks of "the murder" in ch. 4 –
                        before learning it in ch. 6
  ⊗ leaked_secret       Sella references "the heir's true
                        name" in
                        ch. 3 – never established to know it
```

Three kinds of break: **premature_knowledge** (a reference before the grant), **leaked_secret** (a `secret:` topic used by someone never told it), and **dropped_reveal** (a knowledge you set up and then never spent — the epistemic version of a gun on the mantel that never fires). KEN stays **silent** wherever it cannot ground a break; it never invents one.

Where it lives

`inkhaven knowledge` runs the check from the command line and exits non-zero on a hard break, so you can gate a draft before it goes out. In the editor, `Ctrl+B Shift+Z` opens the findings grouped by kind — **Enter** jumps to the paragraph where the character knew too much. And the same findings ride the revision worklist (`Ctrl+V Shift+R`), where you **decide** the fix: cut the reference, move the reveal earlier, or add the grant you forgot.

COST

The whole check is a forward walk plus name-matching — **no model, and it costs nothing at any book size**; it scales with your tags, not your page count, and does nothing at all until you place a tag. Only the opt-in `--deep` pass — for a character who acts knowing **without naming** the fact — asks a language model, and it is cost-capped like every other language pass in this book.

FICTION

For fiction this is the crown jewel — mystery, thriller, betrayal, any story with a secret. KEN is the reader's instinct given a memory: a secret stays secret until you choose to spend it.

NON-FICTION

For non-fiction the axis rarely bites — an argument has no secrets to keep — so KEN stays quiet, which is itself the right answer.

WHAT YOU LEARNED

- **KEN** tracks who knows what, when — the referenced-before-introduced invariant moved from existence to **knowledge**.
- The **grant** (when they could know it) comes from timeline presence + `secret:` / `know:` / `reveals:` tags; a **use** before the grant is the break.
- Findings: **premature_knowledge**, **leaked_secret**, **dropped_reveal** — surfaced in `inkhaven knowledge`, the `Ctrl+B Shift+Z` dashboard, and the `Ctrl+V Shift+R` worklist. Deterministic and free; `--deep` is the only, opt-in, model touch.

PART III

The Book Reads Itself

CHAPTER 5

5

The Read-Through

Every intelligence so far has read your book **small** — a paragraph, a break, a fact. But the reader who matters most does not read small. They read **forward, once, whole**, not knowing the ending, and their experience of the whole is the thing you most want to know and can least see, because you already know how it turns out. KEN's sibling, LECTOR, is that first reader — the book reading itself, end to end.

TERM LECTOR

LECTOR reads the manuscript the way a first-time reader does: forward, once, whole. It reports two things — the **shape** of the read (its dramatic rise and fall) and the **experience** of it (where a reader gets lost, bored, or set the book down).

Shape — measured from the prose

LECTOR measures each chapter's dramatic intensity **from the prose itself** — the density of dialogue, a stakes-and-conflict vocabulary, the acceleration of the sentences, the turn at a chapter's end — with no tagging required. Then it reads that realized curve against the shape your chosen framework intends, and marks the **saggy middle** where the story means to rise but the prose reads flat.

● ● ● *inkhaven readthrough — the shape of the read*

Read-through · 12 chapters · Hero's Journey

measured 

expected 

△ [shape_sag] the shape wants a rise around ch. 5 (~55%) but the

prose reads flat (~12%).

Six frameworks are built in — including the four-movement, conflict-optional **kishōtenketsu** — and the right one is suggested from your declared genre unless you name it yourself.

Audience — what a first reader trips on

The other half walks the book forward carrying the **reader's** state — who they have met, what is still open, how the energy runs — and flags the problems a first reader actually hits, forward-only, so a later payoff never excuses an earlier dip:

● ● ● *The reader-experience findings*

confusion	an entity used before it's introduced
info_dump	too many new names in one chapter
attention_dip	a flat, eventless chapter
put_down_risk	a run of flat chapters – a likely place to stop
unpaid_setup	a promise raised but never paid off

A reader's eyes, on request

The forward walk cannot judge whether the stakes **land**. For that, `readthrough --deep` (or `k` in the `Ctrl+B Shift+A` dashboard) runs a single, cost-capped **synthetic first read** – a language model reacting chapter by chapter as a reader who does not know the ending, seeing only a recap of what came before. It is the one place the book gets a stranger's opinion, and it is always something you ask for.

LECTOR does not replace your first reader. It catches what you would wince at before you hand them the pages.

WHAT YOU LEARNED

- **LECTOR** reads the book forward, once, whole – reporting its **shape** (intensity vs. the framework's intended curve) and the **audience** experience.
- Shape is measured from the prose (no tagging); audience flags confusion, info-dump, attention-dip, put-down risk, and unpaid setup, forward-only.
- `inkhaven readthrough` and `Ctrl+B Shift+A`; the cost-capped **synthetic first read** (`--deep / k`) is the only model touch.

CHAPTER 6

6

The Voices

Give three characters the same lines and a weak book is exposed: they all sound like the author. A strong book gives each a voice you could recognise with the dialogue tags stripped away — a rhythm, a vocabulary, a way of hedging or not. Knowing whether your cast actually sounds like different people is hard from the inside; you hear the voice you **meant**, not the one on the page. CHORUS listens for you.

TERM CHORUS

CHORUS profiles the voices of your book at the scale of the whole cast. It fingerprints each character's speech, measures how **distinct** they are from one another, and watches the discipline of point of view and register — synthesised by a reader in the inner family, the **Inner Stylist**.

A fingerprint, and a distinctiveness matrix

CHORUS builds a statistical fingerprint of each character's dialogue — sentence rhythm, vocabulary richness, how often they ask, exclaim, hedge — and then z-scores the whole cast against itself to find the voices that read **alike**.

● ● ● *inkhaven chorus — the voices, compared*

Voice distinctiveness · 5 speakers

most distinct Grandmother (archaic, long clauses)

least distinct Joren ↔ Cael (0.31) — they read the same

△ two flat voices: consider sharpening Cael's diction.

Sparse voices — a character with three lines — are profiled but never flagged; there is not enough to judge, and CHORUS says so rather than inventing a verdict.

Whose head, and does the tense hold

The other pillar is **discipline**. Declare a scene's point of view with a **pov:** tag, and CHORUS flags a **head-hop** — a named non-viewpoint character whose interiority leaks onto the page — and, in English, a **tense slip**.

HONEST ABOUT RUSSIAN

Tense detection is **English-only, by design**. Russian tense is aspect, and the historical present is legitimate prose; nothing here models aspect, so CHORUS says so rather than false-flag it. Character voice and head-hop work in every supported language.

The Inner Stylist

All of this — voice, distinctiveness, drift, point of view, register — is gathered by the **Inner Stylist**, the seventh reader in Inkhaven’s inner family, into warm observations you can act on (`Ctrl+B J → Y`, or the `Ctrl+B Shift+C` review pass). It coaches; it never rewrites. A voice is yours to give; CHORUS only tells you whether you gave it.

FICTION

For fiction this is the difference between a cast and a crowd — the assurance that the reader can tell who is speaking with the tags removed.

NON-FICTION

For non-fiction voice matters less, but **register drift** — a chapter that slides from plain into jargon and back — is exactly the kind of unevenness CHORUS catches.

WHAT YOU LEARNED

- **CHORUS** profiles the whole cast’s voices: a per-character fingerprint plus a **distinctiveness matrix** that flags voices reading alike.
- It watches **discipline** too — head-hops against a `pov:` tag, and English tense slips (Russian excluded by design).
- The **Inner Stylist** synthesises it into coaching observations; it never rewrites.

PART IV

Knowing Where You Stand

CHAPTER 7

7

Did It Get Better?

Every intelligence in this book diagnoses the draft **in front of you**. But revision is a leap of faith unless you can see it working, and the honest question at the end of a hard week — **did I actually make it better, or did I just move the furniture?** — has no answer if nothing remembers what the book measured last time. CHRONICLE remembers. It is the book's memory of its own drafts.

TERM **Milestone**

A **milestone** is a snapshot of every reader's verdict at one moment — taken with **inkhaven chronicle mark "draft-2"**. It captures the whole diagnostic state (every finding, tallied and fingerprinted) so a later draft can be measured against it.

Mark, then trend

Stamp a milestone before a serious pass. Afterward, **inkhaven chronicle** captures the book again and **trends** it against that mark — every count read the honest way, where **fewer is better**, and regressions sorted to the top so collateral damage cannot hide:

● ● ● *inkhaven chronicle — since the last milestone*

```
Chronicle — since "draft-2" (2026-08-03) → now
findings          31 → 27 ▼ 4 fewer
errors            4 → 2 ▼ cleared 2
shape sag         3 → 1 ▼ improved
confusion (ch.7) 0 → 1 ▲ NEW — introduced by your
edits
```

Cleared, and introduced

The line that matters most is the split. Because every finding carries a stable identity, CHRONICLE knows exactly which ones your revision **cleared** and which **new** ones it **introduced** — proof the work landed, and an early warning on the problem you created reaching for the fix:

● ● ● *The revision, weighed*

✓ 6 cleared ▲ 1 introduced · 20 unchanged

introduced (new since the last mark):

△ confusion ch. 7 an entity used before it's
introduced

Press **Enter** on an introduced finding in the **Ctrl+B Shift+U** dashboard and you jump straight to the paragraph your last edits broke. Good revision often trades one problem for another; this is how you catch the trade before a reader does.

PURE MEASUREMENT

CHRONICLE has **no prose-write path anywhere**. It only ever measures. And because it reads findings the other intelligences already computed, it costs nothing to keep a running record of your book's whole health, draft to draft.

CHRONICLE closes the loop the rest of this book opens: the readers diagnose, you revise, and CHRONICLE tells you whether it worked.

WHAT YOU LEARNED

- A **milestone** (chronicle mark) snapshots every reader's verdict; inkhaven chronicle trends the live book against it, every count **fewer-is-better**.
- The signature move is **cleared vs. introduced** — which findings your revision resolved, and which new ones it created.
- **Ctrl+B Shift+U** opens the dashboard; **Enter** jumps to an introduced finding. Pure measurement — it never edits, and it costs nothing.

CHAPTER 8

8

What the Book Rests On

CHRONICLE remembers what the **readers** found, draft to draft. But underneath the findings sits a second kind of memory the last chapter did not touch — the memory of what you **decided**. The city floats on the back of a sleeping leviathan. The only way out is the sea gate in its flank. The harbour-master has known for years and told no one. None of those is a fact you can look up or a finding a reader can raise; each is a **choice** you made, and the whole book leans on it. Git remembers your words. Nothing, until CANON, remembered your commitments — and so the one question every revision asks had no answer: **if I cut this, what breaks?**

TERM **Decision**

A load-bearing choice behind the story — a **world-fact**, **character trait**, **plot point**, **reveal**, or **setup** — recorded with its **grounds** (the decisions it rests on), a **commitment** level (how settled it is), and a link to the paragraph it came from. It is **canonicity**, not truth: not “is this correct?” but “how firmly has the author committed to it?”

Where decisions come from

You do not keep a story bible by hand. Decisions reach the ledger two ways, and the second is the important promise: a model can **propose**, but nothing enters without your word.

A **rel:** relationship tag you already write — **rel:mentor:Vasa:Iri** on a paragraph — becomes a character-trait decision the moment you save, for free, with no model. And when you want more, **inkhaven canon harvest** asks a model to read a scene and **propose** decisions in your project’s language. They do not enter the ledger. They are **staged**, and one command — **canon accept** — is the only thing in the whole feature that writes.

● ● ● *The model proposes; you decide*

```
inkhaven canon harvest ch-1      # a model reads, and proposes
...
inkhaven canon staged            # ... you review the staged list
...
    4 staged proposal(s) – not yet in the ledger:
      [world-fact] The city of Vell floats on a sleeping
      leviathan.
      [reveal]     Mara never told anyone the tremors are the
      beast.
inkhaven canon accept            # ... and only this commits
them.
```

The one question — what breaks if I cut this?

This is why the ledger is worth keeping. Because each decision records what it rests on, CANON can walk the chain and name the **blast radius** of a cut — before you make it, not three chapters later when the book quietly stops adding up.

● ● ● *canon impact — the cost of a cut, in advance*

```
inkhaven canon impact b3:lypx
  If cut: b3:lypx [world-fact] The city floats on a
  leviathan.
    2 decisions would dangle:
      b3:x3k7 [plot-point] The escape uses the sea gate in
  its flank.
      b3:q0m2 [reveal]      The tremors are the beast
  waking.
```

Cut the leviathan and the ledger tells you, at once, that the escape route and the central reveal both come loose. Its mirror, `canon why b3:x3k7`, runs the chain the other way — the grounds a decision stands on — so you can see not just what depends on a choice but what the choice itself depends on.

Where the grounds come from

That answer rests on the **grounds** — the edges between decisions — and the ledger draws them for you. When a decision enters, its grounds are inferred at no cost: a reveal is grounded on the setup it echoes, a plot point on the world-fact whose subject it reuses, matched on shared content words in your project language. The opt-in harvest goes further, letting the model name which sibling decisions each one rests on. And when you know an edge the tool missed, you draw it yourself — `canon ground <id> --on <ground>`, or `g` on the dashboard — and `canon unground` takes one back. You do not maintain the graph; you correct it.

If you kept a ledger before the tool drew grounds for you, `canon reground` runs the inference across the whole of it at once, so an old ledger's `impact` and `why` light up without a re-harvest. `canon compact` later reclaims the versions

that grounding leaves behind (your decisions and their commitments are kept), and `canon graph` prints the whole shape — each foundation, and what rests on it.

TERM **Grounds**

The decisions a decision rests on. They are what `impact` and `why` walk, so a ledger with no grounds answers nothing — which is why they are inferred automatically and, when needed, drawn by hand.

How settled is it — and am I building on sand?

A decision carries a commitment level, from **floated** through **drafted**, **committed**, and **canonical**, to **retconned**. Marking them lets CANON catch the quiet danger of a scene built on a premise you never really settled:

● ● ● *canon check — a canonical scene on a floated footing*

```
inkhaven canon commit b3:x3k7 --level canonical
inkhaven canon check
  △ b3:x3k7 [plot-point · canonical] The escape uses the
sea gate
  rests on b3:lypx [world-fact · floated] the
leviathan
  - canonical, but its ground is only floated.
```

You have committed hard to the escape while the world-fact it needs is still a maybe. Nothing is wrong with the prose; the **foundation** is soft, and only a ledger that tracks both the decisions and their footings can see it.

FICTION

For the **novelist**, the decisions are the secrets and the scaffolding — the reveal you must not spend early, the premise a whole act leans on. **impact** turns “can I cut this scene?” from a guess into a list.

NON-FICTION

For the **non-fiction** writer, a decision is a load-bearing claim, and its grounds are the argument beneath it. Cut a premise and **impact** names the conclusions that now dangle unsupported — the same question, one field over.

How a decision developed

The ledger is append-only, so it remembers not just where the canon stands but how it **got there**. **canon history** <id> shows one decision’s grounds and its commitment trajectory — floated in chapter two, drafted after the read-through, canonical before you sent it out. **canon log** widens that to the whole book: every commitment you ever made, oldest first, the canon settling draft by draft. This is the **development history** the chapter opened on — the second kind of memory, of the choices rather than the findings.

In the editor, and when two of you disagree

The reader hub (**Ctrl+B *** → **Canon**) opens the ledger as a scrollable dashboard — every decision with its kind and «commitment» — and ↩ jumps to the paragraph a decision came from, the same jump the other ledgers give you. **g** grounds the cursored decision on a target you pick; **h** shows its history in the Thoughts pane; **t** turns the list into the grounds graph.

But the ledger no longer waits for you to open it. A paragraph that **established** a decision wears a ♦ in the tree, and opening it tells you what rests on it. Cycle the right pane (**Ctrl+B Tab**) to **Canon** and the decisions of whatever paragraph you have open sit beside the prose as you move — each with how much rests on it and what it rests on; ↩ follows a ground upstream to the scene that set it, ***** opens the dashboard on that decision. And when you chat with your book, the answer is grounded on the decisions behind the passages it retrieved, not only the passages — the title says ♦ **N canon**, **p** shows which, ***** turns it off for the session.

And you no longer leave the scene to feed the ledger. In the **Canon** pane, **H** asks the model what this paragraph decides; its answers appear as **?** proposals — not yet canon — and you take each with **a** or drop it with **x**. **c** says how settled a decision is, from **floated** to **canonical**, and warns you on the spot if you have just built something firm on something soft. The **◆** darkens as a paragraph’s canon firms up, and when you save a paragraph that other decisions lean on, the status line reminds you once that they do.

When the book and the ledger part ways

A ledger you fill and never check goes stale, and a stale ledger is worse than none — it tells you, and the AI you chat with, that something is decided when the book has moved on. So the ledger checks itself. **inkhaven canon read** — and the Canon dashboard, which now opens with its findings first — tells you four things for free: a decision whose scene no longer mentions it (**drifted**), one whose scene is gone (**orphaned**), a firm decision standing on a soft one (**built on sand**), and a decision much else rests on that you never called settled (**unsettled foundation**).

One thing it cannot work out by counting words is whether a scene says the **opposite**. For that there is an opt-in pass — **canon read --deep**, or **D** on the dashboard — that asks a model once about only the decisions you marked committed or canonical, and shows you the passage. Fix the passage and the finding goes away on its own.

None of this rewrites anything. A **drifted** or **contradicted** decision reaches the Editorial Pass as a choice — the scene or the ledger? — and the rest as briefs. And when you go to **delete** a paragraph that established decisions, the confirmation warns first — naming them and how much rests on them — so “**what breaks if I cut this?**” reaches you at the moment of the cut. (It only warns; the ledger keeps the decisions regardless.)

CANON also meets the Editorial Pass: if you ever **canon merge** a second ledger — a co-writer’s, another device’s — and the two disagree on whether something is canonical, that **commitment fork** joins the worklist (**Ctrl+V Shift+R**) as a brief. There is no line to rewrite; you reconcile the **ledger**, not the prose. A ledger you keep alone never forks, so the day it appears is the day it matters.

DERIVED, AND SAFE TO LOSE

The ledger lives in the project's own `canon.cbor`, beside your prose but never mixed into it — and it is **derived**: rebuildable by re-harvesting the manuscript. Lose it and you lose a re-harvest, never a word of the book. The queries cost nothing and run in milliseconds; the one model path, harvest, is opt-in and confirmed. It is **advisory**, like everything in this book.

WHAT YOU LEARNED

- **CANON** is the memory of your **decisions** — world-facts, plot points, reveals — each recorded with its **grounds** and a **commitment** level (floated → canonical). It tracks canonicity, not truth.
- Decisions enter from the `rel:` tags you save (free, deterministic) or from an opt-in `canon harvest` that **stages** proposals; `canon accept` is the only thing that writes — the model proposes, you decide.
- The headline is `canon impact` — **what breaks if I cut this?** — the blast radius of a decision before the cut; `canon why` runs the grounds the other way; `canon commit` / `canon check` flag a firm choice resting on a soft one.
- It works because **grounds populate themselves** — inferred free from kind + shared words, proposed by the harvest, or drawn by hand (`canon ground` / `unground`, `g` on the dashboard). `canon history` / `canon log` read the development history off the append-only store.
- The reader hub (`Ctrl+B * → Canon`) is the dashboard (`☞ source`, `g ground`, `h history`, `t graph`); the `◆ pip` and the **Canon** pane keep the open paragraph's decisions beside the prose — where `H` harvests, `a / x` confirm or drop a proposal, and `c` sets commitment — and Book-scope chat is grounded on them; deleting a decision's source paragraph warns with its blast radius; `canon forks` (after a `merge`) reaches the Editorial Pass as a brief. The ledger is **derived** and safe to lose — a re-harvest, never prose.
- The ledger **reads back**: `canon read` (and the dashboard) reports decisions that drifted from their scene, lost it, rest on soft ground, or were never settled — free — and, with `--deep` / `D`, passages that contradict a committed decision. The findings join the Editorial Pass and CHRONICLE under `canon`.

KNOW YOUR BOOK

PART V

All Together

CHAPTER 9

9

A Scene Through Every Check

Read separately, these intelligences are eight tools. Used together, on one scene, they are a single sense — the feeling of **knowing your book** that no writer has unaided. Let us take one chapter through all of them, in the order you would actually reach for them, and watch the book come into focus.

The scene: chapter seven, in which Mara confronts Sella about the betrayal.

First, is it true to the world?

Before anything else, the facts. **Ctrl+B Shift+X** checks the page against the Facts book and the compiled world.

● ● ● 1 · *fact-check*

Fact-check · ch. 7

△ "she rode from Rillmark that morning" – the bible puts Rillmark six days away. Fix the geography or the timing.

Then, does the continuity hold?

Ctrl+B Shift+I – the continuity ledger. Physical and temporal first.

● ● ● 2 · *continuity (SENTINEL)*

⊗ *co_location* Mara is at Rillmark and the capital in one scene (ch. 7)

Could she know what she confronts Sella with?

The question continuity cannot ask. **Ctrl+B Shift+Z** – KEN.

● ● ● 3 · *knowledge (KEN)*

⊗ *premature_knowledge* Mara speaks of "the betrayal" in ch. 7 – she is not told of it until ch. 9

There it is — the invisible break. Mara accuses Sella of a thing she has not learned. Move the reveal earlier, or give Mara a grant, and the scene holds.

Do they sound like two people, and how does it read?

`Ctrl+B J → Y` — the voices. And the whole book's shape, `Ctrl+B Shift+A`.

● ● ● 4 · voice (CHORUS) + read-through (LECTOR)

△ Mara ↔ Sella (0.29) — the confrontation reads in one voice.

- [attention_dip] ch. 7 runs low-energy after a flat ch. 6.

Before you move the reveal — what rests on it?

KEN's fix was “move the reveal earlier.” But the reveal is a **decision**, and other decisions may lean on where it sits. `Ctrl+B *` → **Canon**, or `canon impact`, tells you before you touch it.

● ● ● 5 · what breaks if I move it? (CANON)

```
canon impact b3:pgdf [reveal] Sella's betrayal, revealed
ch. 9
  1 decision would be affected:
    b3:x3k7 [plot-point · canonical] Mara's trust survives
to ch. 11
  - moving the reveal earlier undercuts it.
```

Now the “move it earlier” fix is not a shot in the dark: the ledger names the one downstream choice the move would strain, so you decide with the blast radius in view.

Act on it — and confirm it landed

Every finding above rides one worklist, `Ctrl+V Shift+R`, where each gets the right kind of help: a rewrite you review as a diff, a decision you make (“move the reveal or cut the line?”), a brief where structure is yours to move. Fix the scene there — and then, before the next pass, mark a milestone and let CHRONICLE tell you the truth:

● ● ● 6 · *did it get better?* (CHRONICLE)

```
Chronicle – since "before ch.7 pass" → now
  ✓ 3 cleared (co_location, premature_knowledge, the voice
    flag)
  ▲ 0 introduced
```

Three real problems, invisible an hour ago, found and cleared with nothing broken in their place. That is what it means to know your book — not to hold it all in your head, which no one can, but to have an instrument for every question you would otherwise have to answer from memory, and the honesty to tell you when the answer changed.

WHAT YOU LEARNED

- The intelligences compose: facts → continuity → knowledge → voice → shape → what-rests-on-it → act → measure, on one scene.
- Everything converges on the `Ctrl+V Shift+R` worklist to act, and `Ctrl+B Shift+U` (CHRONICLE) to confirm the fix landed without collateral damage.
- Knowing your book is not holding it in your head — it is having an instrument for every question, and the honesty of a changed answer.

PART VI

The Readers Who Question

CHAPTER 10

10

Inner Socrates — the Dialectician

Everything so far in this book **answers**. The Facts bible answers whether a claim is true; SENTINEL answers whether the continuity holds; KEN answers whether a character could know a thing. The four readers in this last part do the opposite, and it is the harder discipline: they **ask**. They are the **inner family** — a small company of readers who live inside your manuscript and question it the way a demanding friend would, each in a different register. The first, and the purest, is Inner Socrates.

TERM The inner readers

Inner Socrates, the Inner Editor, the Inner Theologian, and the Inner Poet are the **inner family** — persona readers who examine your prose rather than measure it. They never rewrite; they observe, question, and leave the judgement to you. Each keeps its own quiet store and surfaces to the Output pane.

The one who only asks

Inner Socrates is a **questioner**, and almost nothing else. It does not praise; it does not prescribe; it does not tell you what to fix. It reads a passage and asks the question the prose has closed over — the assumption you never stated, the significance you have not earned, the objection you did not answer. The point is not the answer. The point is that a good question, read back at the right moment, does something no verdict can: it makes you see your own page as a stranger would.

● ● ● *Ctrl+B J — a passage, questioned*

Inner Socrates · The First-Time Reader

◇ You call the treaty "infamous" — infamous to whom, and have we
 been shown why, or only told the word?
 ◇ Two characters agree at once. What would this scene lose
 if one
 of them resisted first?

A reader for every kind of book

The genius of Inner Socrates is that “the right question” depends on who is reading. So it ships a **roster** of more than a dozen personas — you activate the one whose eyes you want:

• • • *Ctrl+B J* → *S cycles the active persona*

fiction	Inner Socrates · Careful Editor · Skeptical
Reader ·	
	First-Time Reader · Slow Reader
nonfiction	Skeptical Practitioner · Domain Newcomer ·
	Expert Reviewer · End User
ideas	The Dialectician · Theological Reader · Utopian
Architect	

The nonfiction personas stop hunting for scene-time and start asking what a step assumes the reader already knows. The Dialectician reads philosophy for the unnamed premise. The Theological Reader is deliberately **non-empiricist** — it probes coherence and fidelity within a tradition rather than demanding proof. Each is one activation away, and the fast chord follows the one you chose.

THE TWO ADVERSARIES

Inner Socrates is **always** a neutral questioner — except for two personas that break the spine on purpose. The **Defender** states only what works and why to protect it; the **Prosecutor** states only what fails, as a charge. When you want an argument out loud rather than a question, these are it.

Fast and slow

Ctrl+B J opens the overview — the active persona, recent questions, the ledger of what you have already considered. The **fast** track is deterministic and instant. When you want the deeper reading, **Ctrl+B J → E** engages the **slow** track — a cost-capped language pass that reads the passage in the active persona's voice. Notice, Inquiry, Probe: the questions rank from a surface observation to a structural challenge to the whole work, and the quiet default shows you only the ones worth stopping for.

WHAT YOU LEARNED

- The **inner family** — Socrates, Editor, Theologian, Poet — **examines** your prose rather than measuring it, and never rewrites.
- **Inner Socrates** only asks: it surfaces the unstated premise, the unearned significance, the unanswered objection — in the voice of one of a dozen-plus **personas** you activate (Ctrl+B J → S).
- Fast is free and instant (Ctrl+B J); slow is a cost-capped persona reading (Ctrl+B J → E). The **Defender** and **Prosecutor** are the two deliberate exceptions to its neutrality.

CHAPTER 11

11

The Inner Editor

Where Inner Socrates asks, the Inner Editor **observes**. It is the reader who sits with a single paragraph and notices what the prose is actually doing — the tautology you did not hear, the sentence carrying more than its weight, the small excellence worth keeping. It is a craft reader, not a grammar checker: it cares about literacy and style, about whether the language earns its place, and it says so in a warm, specific register that assumes you are a serious writer who wants to be read closely.

TERM The Inner Editor

A single, configurable persona (unlike Socrates' roster) that reads the open paragraph — and a few before it — for craft. It emits **observations**, never edits; a rewrite is always yours to request, review as a diff, and confirm.

Praise, Note, Concern

The Editor speaks at three weights, and it is deliberate about the lightest one:

● ● ● *Ctrl+V O — the Inner Editor's observations*

Inner Editor · ch. 12 ¶ the-vigil

🔍 Praise the triple beat in "she waited, she counted, she forgot to breathe" earns its rhythm.

🔍 Note "the very fact that" carries no weight the sentence

needs — the claim stands without it.

🔍 Concern three sentences in a row open on "It was" — the prose

leans on the same hinge.

Praise must be **earned** — it names a specific thing that works, and is hidden by default so it never becomes flattery. **Note** is the bulk of the reading. **Concern** flags a craft issue worth attention. Its categories run from literary richness and tautology to style instability, dictionary richness, and the belief-stance a passage takes — eight ways of looking at a paragraph, weighted the way you tune them.

It never prescribes

The Editor is **non-prescriptive** by rule. It will not say "you should" or "you must"; it names what it sees and trusts you to decide. When you **do** want a change made, that is the Editorial Pass's job — the Editor's own observation can be handed to the rewrite as the instruction, and even then it lands as a diff you accept, snapshot and

all. The reading and the editing are kept separate on purpose: the Editor's only job is to help you see.

Engaging it

Ctrl+V 0 — **O for Observe** — opens the overview; **E** engages the reading, **A** toggles an ambient reading on a paragraph pause, **F** lists the findings. It is language-model work, so it is cost-aware and off the hot path; a first draft is not the place for a close reader, and the Editor is content to wait for a finished scene. Everything it says is recorded, so a Praise you dismissed today is still there when you come back to harvest the good lines.

FICTION

For fiction the Editor is a line editor with taste — the reader who catches the echo and the crutch, and tells you which sentence is quietly the best on the page.

NON-FICTION

For non-fiction it reads for clarity and completeness as the craft: the undefined leap, the paragraph that says the same thing twice, the place the prose leans.

WHAT YOU LEARNED

- The **Inner Editor** observes a paragraph for craft — literacy and style — in a warm, **non-prescriptive** register; it never says “you should.”
- It speaks at three weights: **Praise** (earned, hidden by default), **Note** (the bulk), **Concern** (a craft issue), across eight categories.
- **Ctrl+V 0** engages it; a rewrite it suggests still lands as a diff you confirm — reading and editing kept apart on purpose.

CHAPTER 12

12

The Inner Theologian

Some books carry moral weight whether or not their authors meant them to. A death is mourned or it is not; a sacrifice means something or it is spent cheaply; a redemption is earned or merely announced. The Inner Theologian is the reader who takes that weight seriously — not to impose a creed, but to ask whether the book is **honest to the moral cosmology it has itself set up**. It is the rarest and quietest of the inner family, and for the books that need it, there is nothing else like it.

TERM The Inner Theologian

A reader of **moral and theological seriousness**, deliberately **tradition-neutral**: it does not judge by any one faith. It reads a passage for what it treats as sacred, costly, or redeemable, and asks whether that holds together — information only, never a verdict on your soul or your prose.

Eleven lenses, no throne

The Theologian never assumes your book's moral frame; it **detects** it. From the passage's own markers — a veil and an awakening, a prophecy and a calling, a cost and a mercy — it selects, from **eleven tradition lenses**, the ones that most illuminate the work, and reads through those rather than through a single doctrine.

● ● ● *inkhaven theologian scan — the lens fits the book*

```
Inner Theologian · ch. 20 ¶ the-reckoning
  lens: Secular Philosophy · Gnostic (the "true world behind
the
      veil" language marks it)
  ☞ The betrayal is forgiven in a line, but the book has spent
    nine chapters making it unforgivable. Is the mercy earned,
or
    only needed for the plot?
  ☞ The cost of the awakening is named but never paid on the
page.
```

Because it is non-empiricist by design, it will never demand that a miracle be proven or a faith be justified. It respects revelation and tradition as **grounds**, and probes the things a moral story can actually get wrong: coherence, fidelity, and scope — whether the claim knows the limits of what it is claiming.

For the books that carry weight

Most manuscripts will never need the Theologian, and it says nothing when it has nothing to say — a thriller with no moral cosmology is not scored against one.

But for theology, philosophy, a utopia arguing its own ethics, or a novel whose whole engine is sin and grace, it reads the one axis every other tool in this book is silent about.

Ctrl+B J → T engages it — a slow, cost-capped reading in two passes: first it **discovers** which of the eleven lenses the work invites, then it **reads** through them. Its observations ride the same review pass as the rest of the family, marked as its own kind, and like every reader here it informs and never prescribes.

WHAT YOU LEARNED

- The **Inner Theologian** reads for moral and theological seriousness, **tradition- neutral**: it asks whether a book is honest to the moral cosmology it set up.
- It **detects** the fitting lenses from a passage's own markers — **eleven tradition lenses** — and probes coherence, fidelity, and scope, never demanding proof.
- **Ctrl+B J → T** engages it; it is silent for books without a moral frame, and informs rather than judges.

CHAPTER 13

13

The Inner Poet

Verse is the one place in a book where the **form** is a promise. Call a stanza a sonnet and you have sworn to fourteen lines and a turn; call it iambic and every foot is a vow. The Inner Poet is the reader who holds you to those vows — measuring what you wrote against what you declared — and it does so under an iron rule that sets it apart from every generative tool: **it never writes a line of verse**. It observes, measures, and reports. The poem stays entirely yours.

TERM The Inner Poet

A reader for verse. You declare a stanza's intended form in a **poem**: block; the Poet measures the actual lines against it — metre, rhyme, syllable count, completeness — and reports the fit. It **observes**, never generates: it will tell you a line runs long, never rewrite it short.

Measured against what you declared

Point the Poet at a stanza with a declared form, and it scans each line — marking stressed and unstressed syllables, checking the rhyme scheme, counting syllables against the metre's demand — and shows you where the verse keeps its promise and where it breaks it.

● ● ● *inkhaven poetry — the form, measured*

```
Sonnet · iambic pentameter · fit 0.86
  L1 / × / × / × / × / × the winter came, and with it came
the cold
      × / × / × / × / × / (declared: iambic — L1 opens with
a trochee)
  L9 x ten syllables wanted, eleven found — "remember" runs
long
rhyme abab cdcd efef gg ✓ intact
```

The glyphs are a poet's shorthand: / a stressed syllable, × an unstressed one, · a syllable the language leaves free. Where the fit is honest, the Poet says so; where a line strains the form, it names the syllable that strained it — and leaves the fixing, as always, to you.

The translator's trilemma

Its most quietly profound tool is for translated verse. A verse translation cannot keep everything — **form**, **sound**, and **meaning** pull against each other, and every translator sacrifices one to save the others. The Poet does not resolve the trilemma

(no tool can); it **measures** it, scoring a translation on how much of each it kept, so you can see the trade you made with your eyes open.

IT WILL NEVER GENERATE VERSE

This is the Inner Poet's whole ethic, and the reason it is a **reader** and not a co-author. A poem is the most personal thing a writer makes; a machine that wrote it for you would not be helping. So the Poet measures, scans, and reports — and the words on the line are always, only, yours.

Ctrl+B J → P opens it — F for the fast scan, E for the deeper reading, D to declare a form, T for the two-column translation view, A for an ambient reading as you write. Like the rest of the inner family, it informs and never prescribes; unlike any of them, it holds a line it could never have written.

WHAT YOU LEARNED

- The **Inner Poet** measures verse against a declared poem: form — metre, rhyme, syllables, completeness — and reports the fit (/ stressed, × unstressed, · free).
- It **never generates verse** — it observes and measures, and the words stay yours.
- It scores the **translator's trilemma** (form vs. sound vs. meaning) so you see the trade you made; Ctrl+B J → P engages it.

APPENDIX A

The Knowledge Commands

Every intelligence in this book has a command line and, where it lives in the editor, a chord. This is the whole set on two pages, for when you know what you want and just need the way to say it.

From the command line

inkhaven
factcheck

Contradictions within the Facts book; SCHOLAR /contradict, /relate.

inkhaven graph ask "..."	Answer a plain question by walking the knowledge graph.
inkhaven graph stats	Node + edge counts, per kind. rebuild / neighbors / paths / contradicting.
inkhaven continuity check	The SENTINEL ledger. --only / --skip / --json; --coherence for the LLM pass.
inkhaven knowledge	The KEN epistemic check. --json; --deep for implied_irony. Non-zero exit on a break.
inkhaven readthrough	The LECTOR read-through. --deep for the synthetic first read; --json.
inkhaven chorus	Voice profiles + the distinctiveness matrix. scan / report / stylist.
inkhaven chronicle	The draft trend since the last mark. mark / list / diff / --json.
inkhaven canon	The decision ledger. impact / why / list / commit / check / forks / context; harvest → staged → accept (only accept writes).

Inside the editor

Ctrl+B Shift+X	Fact-check the open paragraph against the world.
Ctrl+B z	The graph hub — neighbourhood, the edge inbox, graph ask (F9 = the Graph scope).
Ctrl+B Shift+I	The SENTINEL continuity ledger (k = the LLM coherence pass).
Ctrl+B Shift+Z	The KEN knowledge dashboard — who knows what, when.
Ctrl+B Shift+A	The LECTOR read-through dashboard (k = the synthetic first read).
Ctrl+B J → Y	The Inner Stylist — CHORUS's voice observations.
Ctrl+B Shift+U	The CHRONICLE draft-history dashboard (m = mark this draft).
Ctrl+B * → Canon	The CANON decision ledger (↩ = jump to a decision's source paragraph).
Ctrl+V Shift+R	The Editorial Pass — every reader's findings, one worklist, acted on.

Ctrl+B Shift+C The unified review pass — the fast checks in one sweep.

The readers who question (the inner family)

Ctrl+B J Inner Socrates — the overview; J → S cycles the persona, J → E the slow reading.

Ctrl+V O The Inner Editor — O for Observe; E engage, A ambient, F findings.

Ctrl+B J → T The Inner Theologian — the two-pass moral reading (eleven lenses).

Ctrl+B J → P The Inner Poet — F scan, E deep, D declare form, T translation view, A ambient.

inkhaven inner-editor The craft reading. engage / findings / config.

inkhaven theologian The moral reading. scan / session.

inkhaven poetry Verse measured against a declared form. forms / scan / metre / rhyme / trilemma.

The tags that declare knowledge (KEN)

secret:<topic> Marks <topic> a secret — a reference by someone ungranted is a leak.

know:<topic> Grants the scene's pov: character knowledge of <topic> here.

know:<topic>@<name> Grants <name> the knowledge explicitly.

reveals:<topic> On an event's paragraph — binds the event to the fact it reveals.

pov:<name> Declares a scene's viewpoint — used by CHORUS and KEN alike.

From a script (Bund)

Every check reads out to Bund, read-only, for hooks and gates: `ink.knowledge.{grants,findings,check}`, `ink.continuity.{findings,check}`, `ink.readthrough.{report,curve,check}`, `ink.chronicle.{marks,trend,check}`, `ink.canon.{list,impact,why,forks}`, and the graph words. Each check returns a `clean` flag — a one-line pass/fail gate for a pre-submit script.

APPENDIX B

B

Glossary

The vocabulary of knowing your book, gathered in one place.

TERM Advisory

The governing principle: every intelligence observes and reports, and never edits your prose on its own. A change is always a diff you confirm, with your old words a keystroke back.

TERM Fact

A specific, checkable claim your book rests on — a date, a name, a distance — kept in the Facts system book, apart from your prose, so the tool can hold it steady.

TERM Knowledge graph

A layer of typed connections over your book — mentions, event participants, contradictions, citations — derived from what you wrote, walkable, and answerable with **graph ask**.

TERM Continuity (SENTINEL)

The book watching **where** and **when**: co-location, timeline, numeric, character-fact drift, and referenced-before-introduced, in one ranked ledger.

TERM Grant

In KEN, the earliest moment a character could know a topic — derived from timeline presence (they were there) or a **know:** / **reveals:** tag you place.

TERM Epistemic break

A character using knowledge before they have it: **premature_knowledge**, a **leaked_secret**, or a **dropped_reveal** (knowledge set up and never spent). The axis KEN watches that continuity cannot.

TERM Read-through (LECTOR)

The book read forward, once, whole, as a first reader — its **shape** (measured intensity vs. the framework's curve) and its **audience** experience (confusion, info-dump, attention-dip, put-down risk, unpaid setup).

TERM Distinctiveness matrix

CHORUS's z-scored comparison of the whole cast's voice fingerprints — the thing that flags two characters who read alike.

TERM Milestone

A snapshot of every reader's verdict at one moment (**chronicle mark**), so a later draft can be trended against it — cleared vs. introduced.

TERM Decision (CANON)

A load-bearing choice behind the story — a world-fact, character trait, plot point, reveal, or setup — kept in the decision ledger with its grounds, its commitment level, and a link to the paragraph it came from.

TERM Commitment

How firmly the author has settled a decision, on a ladder from **floated** through **drafted**, **committed**, and **canonical** to **retconned**. It is canonicity, not truth: not whether the decision is correct, but how firmly you stand behind it.

TERM Grounds

The decisions a decision rests on. **canon impact** walks them forward — what would dangle if you cut a choice — and **canon why** walks them back, to the choices a decision stands on.

TERM Deterministic / cost-capped

Deterministic means the tool reads your manuscript and its structure with no model, at no cost. Where a language model genuinely helps, it is **cost-capped** and opt-in — you ask, you see the estimate, the default is off.

TERM The worklist

The Editorial Pass (**Ctrl+V Shift+R**): every reader's findings unified into one ranked list, each acted on with the right kind of help — a reviewed rewrite, a decision you make, or a brief where the structure is yours to move.

AFTERWORD

About the author

Vladimir Ulogov.

Vladimir Ulogov has spent decades building infrastructure for distributed systems — the kind of software that watches other software. Early in his career he worked on monitoring and telemetry platforms; later years took him into federated observability, telemetry buses, and the architecture of systems that have to make sense of millions of data points without losing the thread.

Observability, in the end, is the art of **holding a system too large for one head** — of watching it without losing the thread, and never reporting a thing it cannot back up. It is not an accident that a tool he built for writers carries the same instinct to the desk: a book, past a certain size, is exactly such a system, and it too

deserves an instrument that holds it for you.

What makes him slightly unusual in his corner of the industry is a tendency to write his own tools — not in the sense of small utilities, but in the sense of programming languages. The Bund language (its compiler, its VM, its document store, its parser) lives in a long series of Rust crates on crates.io. `rust_dynamic`, `rust_multistack`, `rust_multistackvm`, `bundcore`, `zbus_universal_data_gateway` — each is a building block that exists because the off-the-shelf options didn't fit the shape of the work.

Why these intelligences exist

Inkhaven is Vladimir's personal reflection on how a literary tool can help the people who write books. The intelligences in this book are one answer to a specific frustration: that a manuscript, past a certain length, outgrows the mind writing it — and the tools writers use offer no help holding it. They format the words; they do not **understand** them.

A novelist loses track of who knows what, whether the continuity holds, whether two characters have started to sound alike — not from carelessness, but because no one holds a whole book at once. A non-fiction author loses the thread between a claim and its source, and never sees the two of their own findings that quietly disagree. These features were built to close that gap: to let the tool that holds your words also **know** them — watch the facts, the continuity, the knowledge, the shape, and the voices — so the writer is free to do the one thing no tool can, which is write.

A work of love

Inkhaven is open source. The licence is permissive — you can read it, fork it, study it, modify it, and pass it on. Strictly speaking, the licence also lets you sell it. The author would, gently but firmly, disagree with you doing that. Inkhaven was not designed as a *for sale* project. It is a work of love made for the authors who can least afford to pay for software, and turning it into a commercial product would betray the reason it exists. So please — don't.

It carries no analytics, no telemetry, no upsell. The binary will never phone home; the project will never have an “Enterprise” tier you have to escape from.

This was a deliberate choice. There are excellent commercial tools for writing. They cost money — which is fine for many writers, and a barrier for many more. Inkhaven exists for the second group: for the graduate student writing a dissertation on a battered laptop, for the novelist who shouldn't have to pick between rent and software, for the engineer drafting in the same terminal where they already write code, for anyone who would benefit from a tool that respects their work without asking for a credit-card number.

A note on cooperation

Vladimir believes firmly in the human capacity for mutual help — that we make better work, and live better lives, when we share what we know and what we build. Open source is one of the most concrete expressions of cooperation our era has produced: code read, improved, and passed forward without payment, without permission, by people who will never meet.

If Inkhaven helps you finish your book — that is enough. If it gives you a chord pattern you adapt into your own tool — that's a gift back to the larger project of making software writers can love. As a society, we achieve the greatest things when we help each other rather than compete with each other.

Where to find more

GitHub	@vulogov — the source for Inkhaven, Bund, and the dozen-plus Rust crates that carry the infrastructure. Issues and PRs welcome.
LinkedIn	/in/vladimirulogov — posts on observability, the occasional long-form essay.
YouTube	@vulogov — talks and walkthroughs from the conference trail.
X / Twitter	@vladimir_ulogov

If a fact you grounded ever surprises you, or a command trips you up and you can't find the answer in this book — open an issue on GitHub. The author reads them.
